

BLOOM QUALITY ASSURANCE

Bloom Engineering Company, Inc.'s long-established reputation for quality is founded on a simple idea: to remain focused on state of the art custom designed combustion equipment and refractory products.

Our focus has enabled Bloom to develop process/manufacturing expertise and grow workforce skills which are fundamental to achieving products and services with inherent quality.

No quality system is substitute for 75 years of expertise in our very specialized field; however, no amount of expertise is a substitute for a quality program. Our quality program booklet defines the requirements and guidelines for activities affecting component and system quality so that you may be confident that equipment performance will satisfy your specified needs.

Every person throughout the organization is responsible for work performance which accomplishes the necessary quality. Our quality assurance program is administered at the Corporate Management level by the Vice President – Manufacturing who reports directly to me.

Your comments concerning Bloom's performance and our quality programs are encouraged.
